#### **Our Products**

Unlock unprecedented earnings with our structured crypto products, designed to capitalize all market movements.

Capitalize on market movements and maximize gains with our structured crypto products.

## **Dual Investment**

**Short:** Harness market movements and maximize earnings with Dual Investment Classic, Booster, and Extra.

## Long:

#### Classic

Dual Investment Classic allows you to buy or sell tokens at a predetermined price and date in the future. With the option of Buy Low and Sell High products, you can potentially earn high returns during the holding period.

## [Dual Investment Classic Video]

### What is Dual Investment Classic?

Dual Investment allows you to trade major crypto pairs to and earn profits. You can subscribe to either "Buy Low" or "Sell High" products, and receive returns in either of the cryptocurrencies, depending on their target price. If the target price is reached on the date of expiration, buyers will receive the principal and additional returns in stablecoins. Otherwise, the principal and return will be converted to crypto. Similarly, sellers will receive their principal and additional returns in the underlying asset if they reach the target price at expiration. If not, they will receive the linked asset back, together with their return.

#### What are the benefits of Dual Investment Classic?

Dual Investment Classic offer several benefits: i) You can maximise profits by buying tokens at a lower price or selling them at a higher price. ii) You can earn high passive income regardless of the market's direction. iii) You have the flexibility to customise your investment plan by choosing different underlying asset(s), maturities, and target prices.

## **How does Dual Investment Classic work?**

There are two types of Dual Investment Classic products: Buy Low and Sell High. Buy Low allows you to buy the target token (e.g, BTC) with USDT at a price lower than the spot price. If the target price is reached at maturity, the client's investment principal and return will be converted to the token at the target price. Otherwise, you will receive the USDT principal and return.

Sell High allows you to sell tokens (e.g, BTC) for USDT at a price higher than the spot price. If the target price is reached at maturity, the client's investment principal and return will be converted to USDT at the target price. Otherwise, the client will receive the investment principal and return in investment tokens.

#### When should I use Dual Investment Classic?

Dual Investment Classic can be used in various scenarios to diversify your portfolio and hedge against uncertain crypto markets. Here are a few examples:

- •Buy tokens at a lower price: Set a target price lower than market rate to buy tokens while enjoying high passive income;
- •Sell tokens at a higher price: Set a target price higher than market rate to sell tokens while enjoying high passive income;
- •Express a market view to earn high passive income: If you believe the token price will not trade above or below a certain level, you can enter into a relevant Dual Investment Classic to earn passive income that is significantly higher than the market rate

### What are the risks of Dual Investment Classic?

In the event that the spot price exceeds the target prices, both the principal and return will be converted at the specified target price. This means that there is a potential missed opportunity to buy or sell the token at a better market price than the target price.

## How is the APR determined?

For a given tenor, the APR is related with the target price. In Buy Low products, a lower target price results in a reduced APR. Conversely, in Sell High products, a higher target price corresponds to a lower APR.

### How is the return calculated?

The return in the investment asset is calculated as follows: Subscription amount \* APR \* Duration / 365.

"Duration" refers to the number of interest days during the subscription period, which will be presented on the subscription page. The return in the investment asset may be converted to the target asset depending on whether the target price is reached at maturity.

#### What is the Expiration Price?

The Expiration Price is the time-weighted average price of spot contracts traded on major exchanges, such as Binance, OKX, Coinbase, Kraken, and Kucoinetc, from 3:00 pm to 3:30 pm (UTC +8). The spot contract prices are mid-prices and are updated every 10 seconds.

### Can I cancel my subscription?

The trade will go into effect once you agree all the terms and confirm the subscription. The trade cannot be cancelled before maturity and you will only receive your asset at maturity

#### **Booster**

Dual Investment Booster is designed for yield enhancement, by offering a higher return than Classic, if the target price is not reached. The return of Dual Investment Booster is much higher than the return of Dual Investment Classic with the same target price, and you can only receive the coupon if the target price is not reached at maturity.

## [Dual Investment Booster Video]

#### **FAQs**

#### What is Dual Investment Booster?

Dual Investment Booster works similarly to Dual Investment Classic. The difference is that it offers a much higher return if the target price is not reached at maturity.

### What are the benefits of Dual Investment Booster?

Dual Investment Booster offer several benefits: i) You can maximise profits by buying tokens at a lower price or selling them at a higher price. ii) You can earn high passive income regardless of the market's direction. iii) You have the flexibility to customise your investment plan by choosing different underlying asset(s), maturities, and target prices.

#### **How does Dual Investment Booster work?**

There are two types of Dual Investment Booster products: Buy Low and Sell High.

Buy Low allows you to buy the target token (e.g, BTC) with USDT at a price lower than the spot price. If the target price is reached at maturity, the client's investment principal and return will be converted to the token at the target price. Otherwise, you will receive the USDT principal and return.

Sell High allows you to sell tokens (e.g, BTC) for USDT at a price higher than the spot price. If the target price is reached at maturity, the client's investment principal and return will be converted to USDT at the target price. Otherwise, the client will receive the investment principal and return in investment tokens.

#### When should I use Dual Investment Booster?

Dual Investment Booster can be used in various scenarios to diversify your portfolio and hedge against uncertain crypto markets. Here are a few examples:

•Buy tokens at a lower price: Set a target price lower than market rate to buy tokens while enjoying high passive income;

- •Sell tokens at a higher price: Set a target price higher than market rate to sell tokens while enjoying high passive income;
- •Express a market view to earn high passive income: If you believe the token price will not trade above or below a certain level, you can enter into a relevant Dual Investment Classic to earn passive income that is significantly higher than the market rate.

## What are the risks of Dual Investment Booster?

If the spot price move beyond the target prices, the principal will be converted at the target price and there will be no return. This means that clients may miss the opportunity to buy or sell the tokens at a market price that could be better than the target price.

#### How is the APR determined?

For a given tenor, the APR is related to the target price. In Buy Low products, a lower target price results in a reduced APR. Conversely, in Sell High products, a higher target price corresponds to a lower APR.

#### How is the return calculated?

The return on the investment asset is calculated as follows: Subscription amount \* APR \* Duration / 365.

"Duration" refers to the number of interest days during the subscription period, which will be presented on the subscription page. The return in the investment asset may be converted to the target asset depending on whether the target price is reached at maturity.

## What is the Expiration Price?

The Expiration Price is the time-weighted average price of spot contracts traded on major exchanges, such as Binance, OKX, Coinbase, Kraken, and Kucoinetc, from 3:00 pm to 3:30 pm (UTC +8). The spot contract prices are mid-prices and are updated every 10 seconds.

### Can I cancel my subscription?

The trade will go into effect once you agree to all the terms and confirm the subscription. The trade cannot be cancelled before maturity and you will only receive your asset at maturity.

#### **Extra**

Dual Investment Extra offers high returns on your investment token while providing a safety range that prevents the principal from being converted when the target price is reached. The principal and return will only be converted when the protection price is reached at maturity. The coupon of Dual Investment Extra will be slightly lower than the return for Dual Investment Classic with the same target price.

## [Dual Investment Extra Video]

#### **FAQs**

#### What is Dual Investment Extra?

Dual Investment Extra provides a safety range to prevent the principal from being converted when the target price is reached. The principal and return will only be converted when the protection price is reached at maturity. At the same time, the return for Dual Investment Extra is slightly lower than that of Dual Investment Classic, with the same target price.

# What are the benefits of Dual Investment Extra?

Dual Investment Booster offer several benefits: i) You can maximise profits by buying tokens at a lower price or selling them at a higher price. ii) You can earn high passive income regardless of the market's direction. iii) You have the flexibility to customise your investment plan by choosing different underlying asset(s), maturities, and target prices.

### **How does Dual Investment Extra work?**

There are two types of Dual Investment Extra products: Buy Low and Sell High.

Buy Low allows you to buy the target token (e.g, BTC) with USDT at a price lower than the spot price. If the target price is reached at maturity, the client's investment principal and return will be converted to the token at the target price. Otherwise, you will receive the USDT principal and return.

Sell High allows you to sell tokens (e.g, BTC) for USDT at a price higher than the spot price. If the target price is reached at maturity, the client's investment principal and return will be converted to USDT at the target price. Otherwise, the client will receive the investment principal and return in investment tokens.

### When should I use Dual Investment Extra?

Dual Investment Extra can be used in various scenarios to diversify your portfolio and hedge against uncertain crypto markets. Here are a few examples:

- •Buy tokens at a lower price: Set a target price lower than market rate to buy tokens while enjoying high passive income;
- •Sell tokens at a higher price: Set a target price higher than market rate to sell tokens while enjoying high passive income;
- •Express a market view to earn high passive income: If you believe the token price will not trade above or below a certain level, you can enter into a relevant Dual Investment Classic to earn passive income that is significantly higher than the market rate.

### What are the risks of Dual Investment Extra?

In the event that the spot price exceeds the target prices, both the principal and return will be converted at the specified target price. This means that there is a potential missed opportunity to buy or sell the token at a better market price than the target price.

## How is the APR determined?

For a given tenor, the APR is related with the target price. In Buy Low products, a lower target price results in a reduced APR. Conversely, in Sell High products, a higher target price corresponds to a lower APR.

#### How is the return calculated?

The return in the investment asset is calculated as follows: Subscription amount \* APR \* Duration / 365.

"Duration" refers to the number of interest days during the subscription period, which will be presented on the subscription page. The return in the investment asset may be converted to the target asset depending on whether the target price is reached at maturity.

## What is the Expiration Price?

The Expiration Price is the time-weighted average price of spot contracts traded on major exchanges, such as Binance, OKX, Coinbase, Kraken, and Kucoinetc, from 3:00 pm to 3:30 pm (UTC +8). The spot contract prices are mid-prices and are updated every 10 seconds.

## Can I cancel my subscription?

The trade will go into effect once you agree all the terms and confirm the subscription. The trade cannot be cancelled before maturity and you will only receive your asset at maturity.

## **Future Plus**

**Short:** Make accurate market predictions and invest with unlimited upside and limited downside.

#### Long:

Future Plus is a leveraged structured product designed for directional market speculation. Compared to vanilla futures or perpetual contracts, there are no liquidations of the position before the close time, with unlimited upside potential and capped downside risk.

- Up to 50x leverage
- ✓ No liquidation before maturity
- ✓Unlimited upside, limited downside

## [Future Plus Video]

#### What is Future Plus?

Future Plus is a structure product that allows you to hedge on directional movements and earn high returns with leverage. Compared to vanilla futures or perpetual contractions, your position will not be liquidated before maturity. Also, the potential for upside earnings is limited, while your downside losses are limited.

### What are the benefits of Future Plus?

Future Plus offers several benefits: i) You can earn leveraged returns if they accurately predict the market's direction. ii) Your position is guaranteed until the close time, and you have the option of terminating it early iii) You can enjoy high leverage returns with limited risk.

#### How does Future Plus work?

There are two different scenarios: Bullish and Bearish.

In a bullish scenario, if the Expiration Price is at or above the Breakeven Price, you will gain a leveraged profit. Conversely, if the Expiration price is below the Breakeven Price, you will still receive your investment, but at a capped loss.

The same principle works for a bearish scenario, but in reverse.

### When should I use Future Plus?

You can use Future Plus when you want to make directional trades, and if you only want to risk limited capital.

### What are the risks of Future Plus?

The risk of Future Plus is potential losses if the market moves against your position. The maximum loss is restricted to the principal committed amount.

### What is the Settlement Price?

The Settlement Price is the time-weighted average price of spot contracts traded on major exchanges, such as Binance, OKX, Coinbase, Kraken, and Kucoinetc, from 3:00 pm to 3:30 pm (UTC +8) on close date. The spot contract prices are mid-prices and are updated every 10 seconds.

## Can I cancel my subscription or close the trade early?

The trade will be executed once you agree to all the terms and confirm the subscription. You cannot cancel the subscription, but you can choose to close the trade early at the market price. Should you close the trade early, the redemption amount will be calculated based on the market prices and returned to your account immediately.

## **Convert Plus**

**Short:** Buy or sell crypto with guaranteed spot prices. Unlock additional returns by benefitting from future price changes.

**Long:** Experience the power of simultaneous conversion and earnings. Secure a guaranteed spot price while capitalising on potential future price fluctuations to optimise your total returns.

- ✓ Additional returns up to 300% p.a
- ▼Trade popular cryptocurrencies: BTC, ETC, USDT

## [Convert Plus Video]

#### **FAQs**

#### What is Convert Plus?

Convert Plus allows investors to fix the price to buy or sell crypto. At the same time, it offers a potential for earning additional returns if the market trades within a certain range at maturity.

#### What are the benefits of Convert Plus?

Convert Plus enables you to gain a higher return when you convert one token into another. The conversion price is locked in at the time of trade, and a notably high return is realized if the spot price falls within a specific range.

### How does Convert Plus work?

Convert Plus combines flow products and exotic options. By setting a future conversion price and locking the fund/token until maturity, our platform can buy an exotic option and generate additional returns. This enables you to profit if the market moves in your favour.

### When should I use Convert Plus?

You can use Convert Plus when you want to convert popular cryptocurrencies such as BTC or ETH to receive stable coins such as USDT, and vice versa.

#### What are the risks of Convert Plus?

# How is Convert Plus different from spot conversion?

There are 2 key differences between Convert Plus and Spot conversion.

 Convert Plus ensures a guaranteed conversion of your investment asset at the Conversion Price. Also, you can earn additional returns based on the spot price at maturity. 2) Upon trade date, your investments funds or tokens will be locked. You will receive the target asset at the maturity date.

## What is the Expiration Price?

The Expiration Price is the time-weighted average price of spot contracts traded on major exchanges, such as Binance, OKX, Coinbase, Kraken, and Kucoinetc, from 3:00 pm to 3:30 pm (UTC +8). The spot contract prices are mid-prices and are updated every 10 seconds.

## Can I cancel my subscription?

The trade will go into effect once you agree all the terms and confirm the subscription. The trade cannot be cancelled before maturity and you will only receive your asset at maturity

# Twin-Win

**Short:** Make the most of volatile markets to earn significant returns with high leverage.

**Long:** Twin-Win is a leveraged structured product designed to deliver significant returns to investors. By capitalising on volatile market movements, you can earn substantial profits when the spot price at maturity moves beyond the break-even prices.

Short term investment

✓Up to 50x leverage

[Twin-Win Video]

**FAQs** 

## What is Twin-Win?

Twin-Win is a structured product where you can maximise returns on volatile market swings. As long as the spot price at maturity moves beyond the break-even prices, you can make a large profit as the product is highly leveraged.

### What are the benefits of using Twin-Win?

Twin-win offers a leverage of up to 50x, this means that the there is a potential for realising high returns. Additionally, Twin-Win is a short-term investment product, with a tenor of 1 to 3 days.

### When should I use Twin-Win?

You can consider trading Twin-Win in the following scenarios:

- 1. You believe that there will be significant market fluctuations but are unsure of the direction
- 2. Before important events, such as the U.S. CPI release, FOMC meeting,
- 3. When the implied volatilities are low as the options are cheap

#### **How does Twin-Win Work?**

Twin-Win is a hybrid product that combines vanilla and exotic options. It involves allocating the investment principal to buy a series of options that generates returns during significant market movements.

# Are there any risks associated with Twin-Win?

There is the risk of losing your initial investment if the observation price at maturity falls between the Upper and Lower Breakeven prices.

## How should I choose the breakeven prices?

You will receive your returns only if the observation price at maturity exceeds the breakeven prices. The proximity of the breakeven prices to the initial spot prices determines the ease of achieving a return and the level of leverage. The closer the breakeven prices to the initial spot prices, the likelihood of earning returns is higher, with lower leverage. If the breakeven prices are far away from the initial spot price, the likelihood of earning returns is lower, with higher leverage.

## What is the Expiration Price?

The Expiration Price is the time-weighted average price of spot contracts traded on major exchanges, such as Binance, OKX, Coinbase, Kraken, and Kucoin etc, from 3:00 pm to 3:30 pm (UTC + 8). The spot contract prices are mid-prices and are updated every 10 seconds.

## Can I cancel my subscription?

The trade will go into effect once you agree to all the terms and confirm the subscription. The trade can not be cancelled before maturity and you will only receive your asset at maturity.

# **Protective Earn**

**Short:** Tailor your investment strategies and maximise earnings with robust risk protection.

**Long:** Protective Earn is a flexible and customisable investment option that enables you to tailor your risk-reward combinations based on your strategy. Depending on your perspective on the future trend of the linked asset (BTC or ETH), outlook, and risk appetite, you can easily customise various Auto Take Profit prices and downside Protection Prices.

✓ Earn higher yield than the market rate

- ✓ Price protection limits losses
- ✓ Customisable investment strategy

## [Protective Earn video]

### **FAQs**

#### What is Protective Earn?

Protective Earn is a structured product that offers periodic returns with flexible terms. Depending on your investment strategy, you can tailor your risk-rewards combinations by customising key parameters such as maturity, Take Profit prices and downside Protection Prices, and more.

# What are the benefits of using Protective Earn?

With Protective Earn, you can earn a more stable return as it is available regardless of whether it falls below the protection price at the end of the subscription period.

Compared to staking, which offers a fixed APR, Protective Earn offers more flexibility and the potential for higher returns in a volatile market. Also, Protective Earn involves popular cryptocurrencies such as BTC, ETH, and USDT, where the settlement currency follows the respective cryptocurrencies, instead of being converted to other tokens.

## When should I use Protective Earn?

Protective Earn is useful in scenarios where you anticipate that i) the future price trend of the linked asset will be confined within a range ii) you have a market view on the linked asset's short-term maximum potential drawdown.

Protective Earn offers the potential to earn a greater return compared to other financial products. We advice you to do your own research to make an informed decision.

#### How does Protective Earn work?

Protective Earn is designed based on Fixed Coupon Notes, an established options structure that is suitable for investors with a positive long-term outlook on the linked asset. Despite potential high volatility, this transparent financial derivative offers the opportunity for higher returns compared to other products. Also, it operates independently of fund pools or speculative activities such as gambling.

If you make an accurate evaluation of the maximum potential decline of the linked assets in the short term, you can benefit from a fixed income that is higher than other wealth management products upon settlement.

### Are there any risks associated with Protective Earn?

Protective Earn is a non-capital-protected product. This means that there is a potential for losses if the observation price of the linked asset falls below the initial price. However, the predetermined protection price can help to mitigate losses.

# What are the Auto Take Profit price and Protection Price?

The Auto Take Profit Price defines the upper limit of the price range. This indicates your view that the cryptocurrency's price will not rise above this level.

The Protection price defines the lower limit of the price range. This indicates your view that the price will not drive below this level.

When combined, these features enable investors to leverage Protective Earn to manage risk exposure while earning higher potential returns, based on their market outlook.

### When will the interest start to accrue?

If you subscribe to the product prior to 2:30 PM (UTC+8) on any given day, interest will begin accruing at 3:30 PM (UTC+8) on the same day. However, if you subscribe to the product after 2:30 PM (UTC+8), interest will start accruing at 3:30 PM (UTC+8) on the next day.

## What is Daily Observation Price?

The Daily Observation Price is the time-weighted average price of spot contracts traded on major exchanges, such as Binance, OKX, Coinbase, Kraken, and Kucoin etc, from 3:00 pm to 3:30 pm (UTC + 8). The spot contract prices are mid-prices and are updated every 10 seconds.

## Can I cancel my subscription?

If you subscribe to the product before 2:30 PM (UTC+8) on a given day, you can cancel the subscription by 2:30 PM (UTC+8) on that same day. However, if you subscribe to the product after 2:30 PM (UTC+8) on a given day, you can still cancel the subscription before 2:30 PM (UTC+8) on the following day.

## **Shark Fin**

**Short:** Earn guaranteed returns regardless of market movement. Unlock bonus rewards with accurate market views.

**Long:** Shark Fin is a principal-protected product that allows investors to benefit from the volatility of the cryptocurrency market with relatively low risk. Depending on your market view, you could invest in a bullish or bearish product. If the expiration price falls within the specified range at the time of maturity, you can earn a bonus coupon at a higher yield than the market rate.

Principal protection

✓ Guaranteed minimum return

## [Shark Fin Video]

### **FAQs**

#### What is Shark Fin?

Shark Fin is a structured investment product that offers principal protection and a guaranteed minimum return. If investors accurately express their market view (Bullish or Bearish), they can earn additional returns.

# What are the benefits of using Shark Fin?

With principal protection and a guaranteed minimum return, Shark Fin is a relatively low risk product. At the same time, it enables you to participate on market movements and monetise your views.

#### How does Shark Fin work?

There are two different scenarios: Bullish and Bearish. If your expressed view of the market is correct, and the expiration price is within the Lower price and Higher Price you will receive your principal investment, guaranteed return, and additional return.

Conversely, if the expiration price is above the Higher Price or below the Lower Price, you will receive your principal investment and guaranteed return only.

# When should I use Shark Fin?

If you are new to cryptocurrency investing or have a low-risk appetite, Shark Fin provides minimal risk as your principal is always guaranteed.

## What are the risks of Shark Fin?

The risks of Shark Fin are relatively low. Once you subscribe to the product, your funds are locked and you will only receive them at maturity.

### How is the APR determined?

The APR consists of two parts: 1) Guaranteed minimum coupon 2) Bonus coupon.

The bonus coupon will depend on the expiration price at maturity. If the expiration price falls within the specified range, then the bonus coupon will be calculated according to the formula: Additional Coupon = Participation Rate \* (Higher Price – Expiration Price)/Higher Price

## How is the return calculated?

Your returns are calculated according to the following formula: Subscription amount \* APR \* Duration / 365.

## What is the Expiration Price?

The Expiration Price is the time-weighted average price of spot contracts traded on major exchanges, such as Binance, OKX, Coinbase, Kraken, and Kucoin etc, from 3:00 pm to 3:30 pm (UTC + 8). The spot contract prices are mid-prices and are updated every 10 seconds.

# Can I cancel my subscription?

The trade will go into effect once you agree to all the terms and confirm the subscription. The trade cannot be cancelled before maturity and you will only receive your asset at maturity.
